

## Overview of the Methodological Framework of the Regional VA

Training on Applying the Climate Change Vulnerability Assessment Methodology in the Arab Region, 11-13 May 2014, Beirut

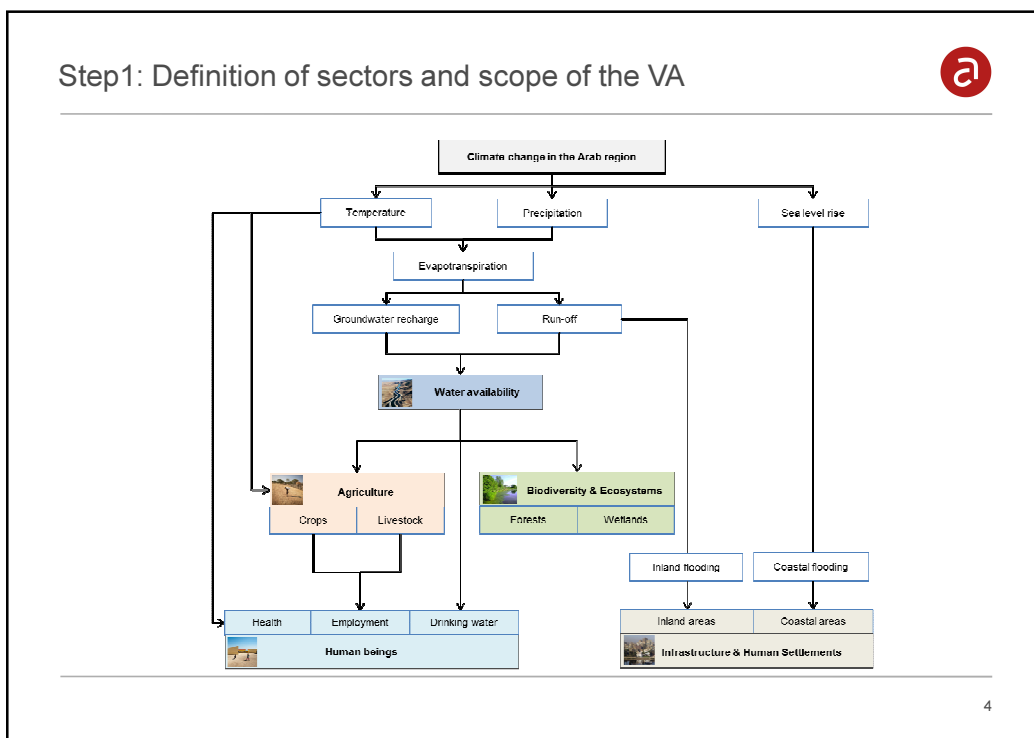

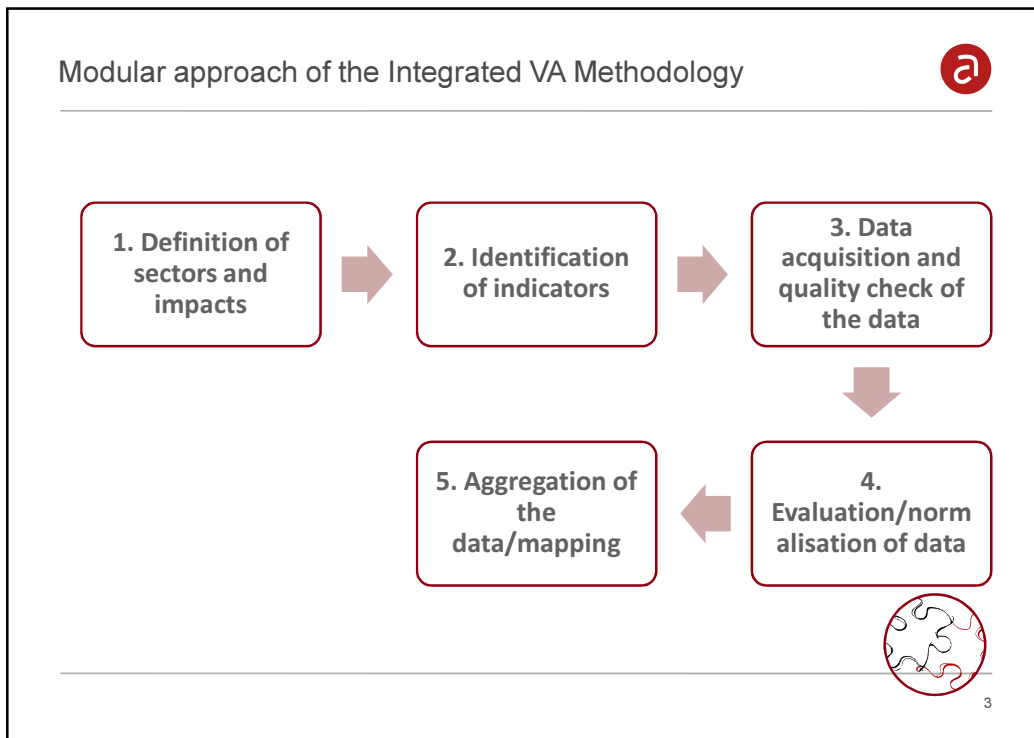

Kerstin Fritzsche, Project Manager, adelphi

### VA Training Manual

- Part I: Outlines conceptual approach of the Vulnerability Assessment Methodology including selection of sectors, key climate change impacts and indicators
- Part II: Outlines the step-wise VA methodology
- Part III: Provides detailed information on the implementation of the methodology using GIS
- Part IV: Advice on how the VA methodology can be adapted for the national level
- Annex: List of indicators and data sources

## Step 1, cont'd: Multisectoral scope

Water

Change in water availability

Biodiversity &  
Ecosystems

Change in area covered by forests

Change in area of wetlands/marshes

Agriculture

Change of water available for crops

Change of water available for pasture/livestock

Infrastructure &  
Human Settlements

Damage from inland flooding

Damage from coastal flooding

People

Change of water available for drinking

Change in health stress due to rising temperatures

Change of employment rate in the agricultural sector

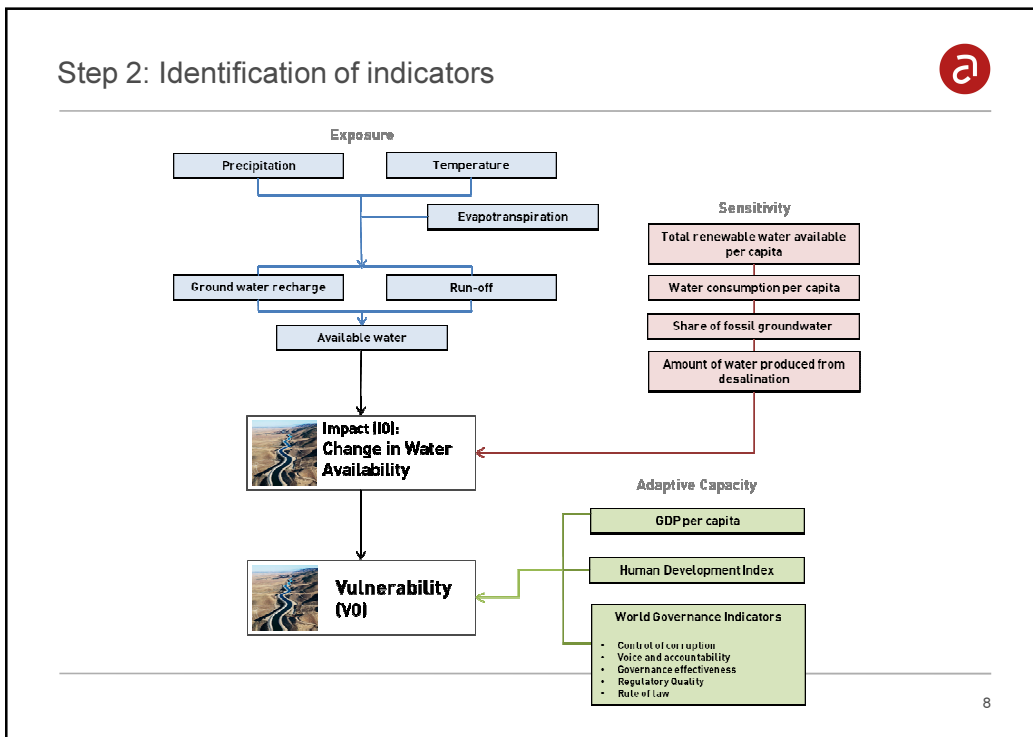

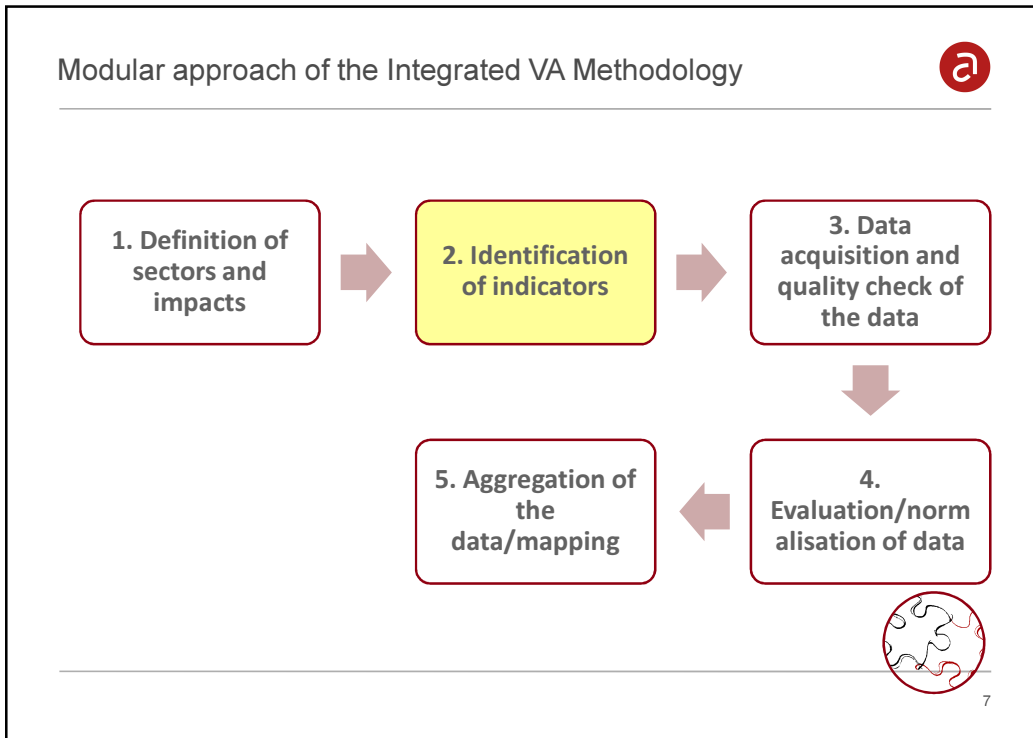

5

## Step 1, cont'd: Spatial and temporal scope &amp; scenarios

- Regional scope: all 22 Arab countries
- Temporal scope:
  - Reference period from 1985-2005
  - Future periods: 2016 to 2035, 2046 to 2065, 2081 to 2100
- Representative concentrations pathways (RCPs):
  - RCP 4.5 (medium) and RCP 8.5 (high)

6

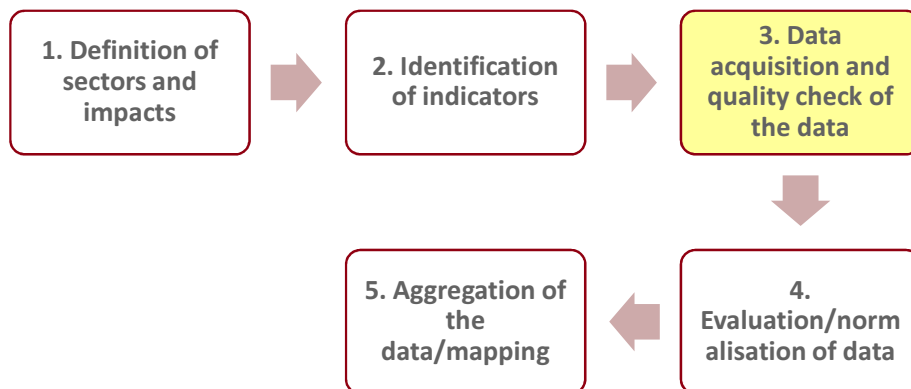

## Step 2, cont'd: Identification of indicators

	Indicator / Index	Description	Unit	Spatial resolution
Exposure	Change in ground water recharge rate	Indicates (projected/future) trends and changes in available groundwater	mm	50*50km
	Change in run-off	Indicates (projected/future) trends and changes in run-off	mm	50*50km
	Total renewable water available per capita (TARWR)	Indicates human pressure on renewable but finite resources.	m <sup>3</sup> /capita/yr	national level (one value per country)
Sensitivity	Water consumption per capita	Indicates the intensity of use of actual water resources	m <sup>3</sup> /capita/yr	national level (one value per country)
	Share of fossil ground-water	Indicates the intensity of use of finite and non-renewable water resources	%	tba
	Amount of water produced from desalination	Indicates the share of water produced from desalination.	m <sup>3</sup> /year or m <sup>3</sup> /year/capita	national level (one value per country)
	Water reuse rate	Indicates the reuse rate of wastewater	%	national level (one value per country)
	Water dependency	Indicates the dependency on water which is received from other countries.	Aquastat	national level (one value per country)
Adaptive Capacity	Water storage capacities (dams)	Indicates the amount of water which potentially can be stored in dams and used e.g. for irrigation.	ACSAD	Point values for dams and storage capacity by dam
	GDP per capita	Indicates the per-capita welfare and is used as an indicator for living general conditions	\$/capita	15*15 minutes grid
	HDI	Indicates the social and economic development based on four criteria: Life expectancy at birth, mean years of schooling, expected years of schooling and gross national income per capita.	0 to 1	national level (one value per country)
	Control of corruption	World governance indicators indicate the traditions and	-2.5 to 2.5	national level

9

## Modular approach of the Integrated VA Methodology

10

### Step 3: Data Acquisition

#### Exposure indicators:

- RCMs and RHM

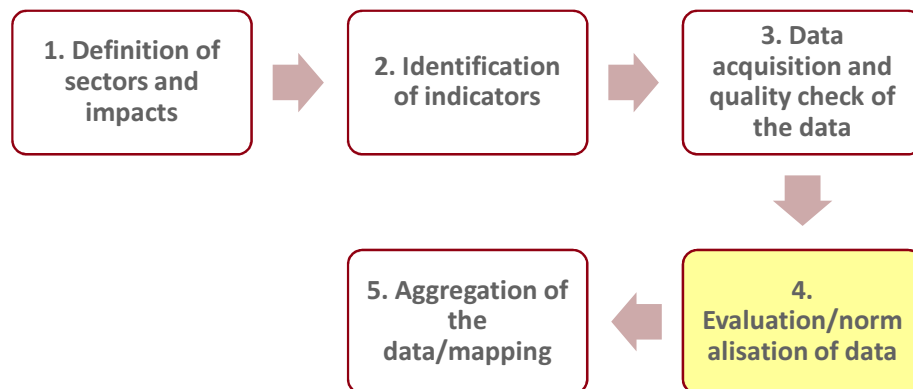

#### Sensitivity & adaptive capacity indicators:

- Relying on already available data from regional as well as international institutions (e.g. ACSAD, FAO/Aquastat WHO, etc.)
- Available LULC (Modis), DEM, topographic maps, etc.

 Data availability & quality is essential for the assessment!

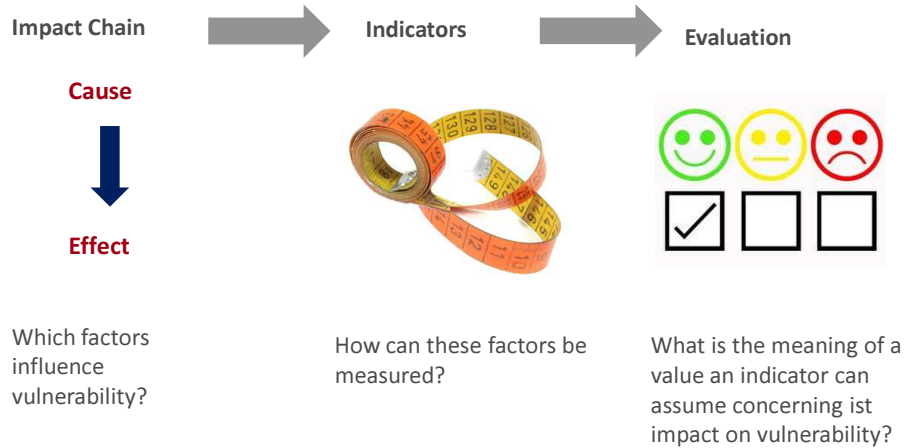

11

### Modular approach of the Integrated VA Methodology

12

## Step 4: Evaluation/Normalisation of Indicators

Stefan Schneiderbauer, 2013.

13

## Step 4, cont'd: Evaluation/Normalisation

••• Min-max normalisation:

Applied on metric data with a rather linear relationship to vulnerability:

$$X_{i, 0 \text{ to } 1} = \frac{X_i - X_{\text{Min}}}{X_{\text{Max}} - X_{\text{Min}}}$$

$X_i$  = Each data point  $i$   
 $X_{\text{Min}}$  = The minima among all the data points  
 $X_{\text{Max}}$  = The maxima among all the data points  
 $X_{i, 0 \text{ to } 1}$  = The data point  $i$  normalized between 0 and 1

14

Min-max normalisation

Bringing normalised values on a scale from 1-10

Class	Normalised data value	Class	Normalised data value
1	0 – 0.1	6	0.5 – 0.6
2	0.1 – 0.2	7	0.6 – 0.7
3	0.2 – 0.3	8	0.7 – 0.8
4	0.3 – 0.4	9	0.8 – 0.9
5	0.4 – 0.5	10	0.9 – 1.0

15

Evaluation of indicators using expert opinion

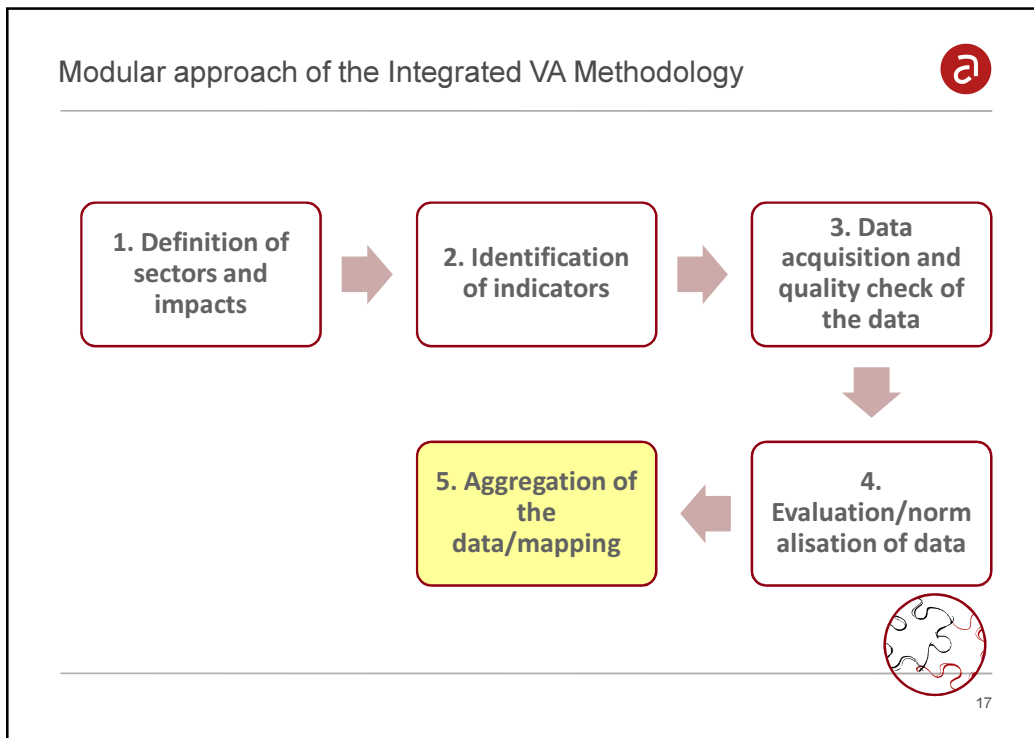

Land Use Land Cover Classes:

1. Forest
2. Cropland
3. Bare soil/gravel
4. Sand (beach/desert)
5. Urban
6. Salt pans
7. Water
8. Sparse vegetation
- + Wetlands

16

### Step 5: Aggregation

••• Geometric aggregation approach:

- State-of-the-art, used e.g. in the HDI and the European Index for Risk Management
- Allows only partial compensability

**Weighted Arithmetic Mean**

**Weighted Geometric Mean**

18

## Step 5, cont'd: Aggregation

### ❖ Different levels of aggregation:

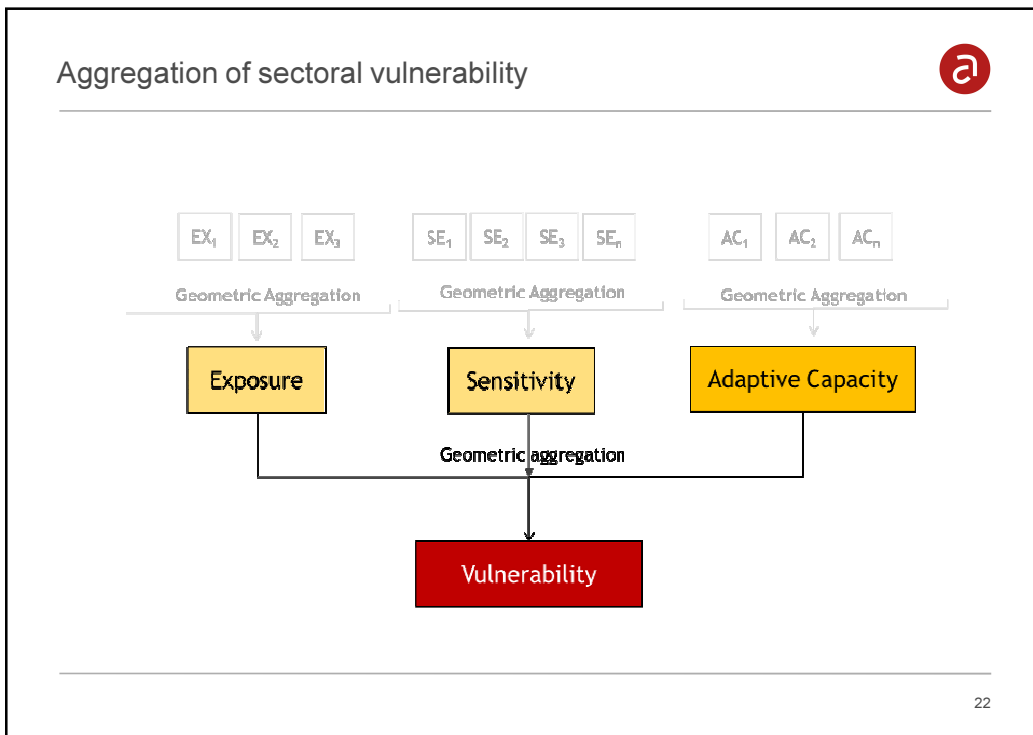

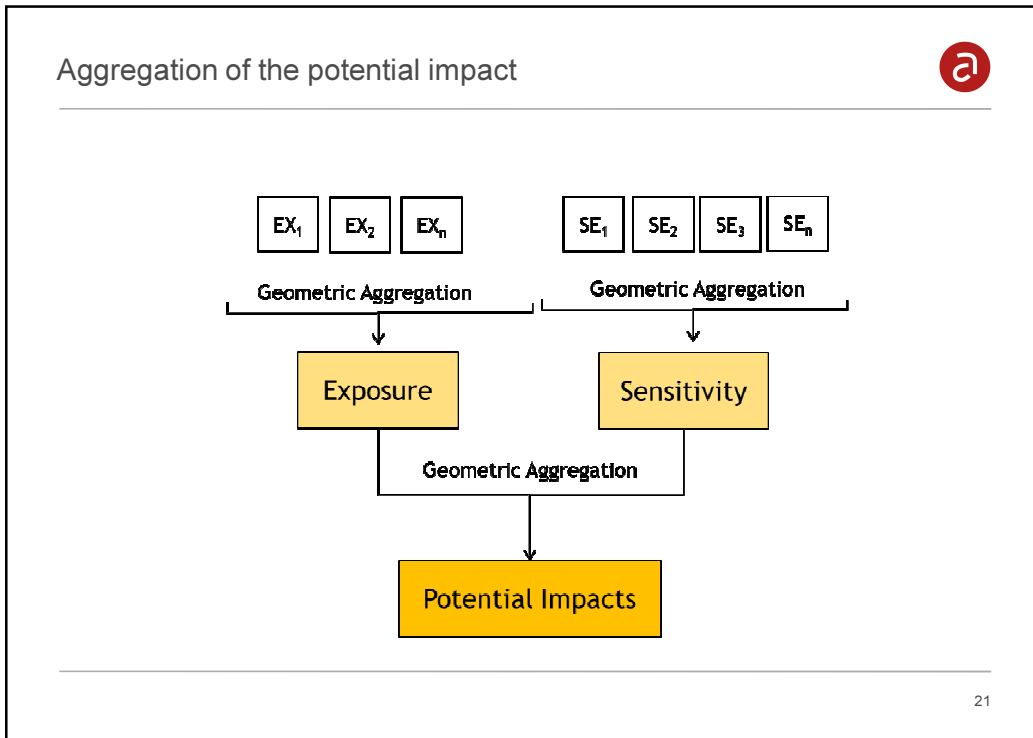

- Indicators to vulnerability components (exposure, sensitivity, adaptive capacity)
- Components exposure and sensitivity to potential impact
- Components exposure, sensitivity and adaptive capacity to vulnerability
- Sectoral vulnerability to overall vulnerability

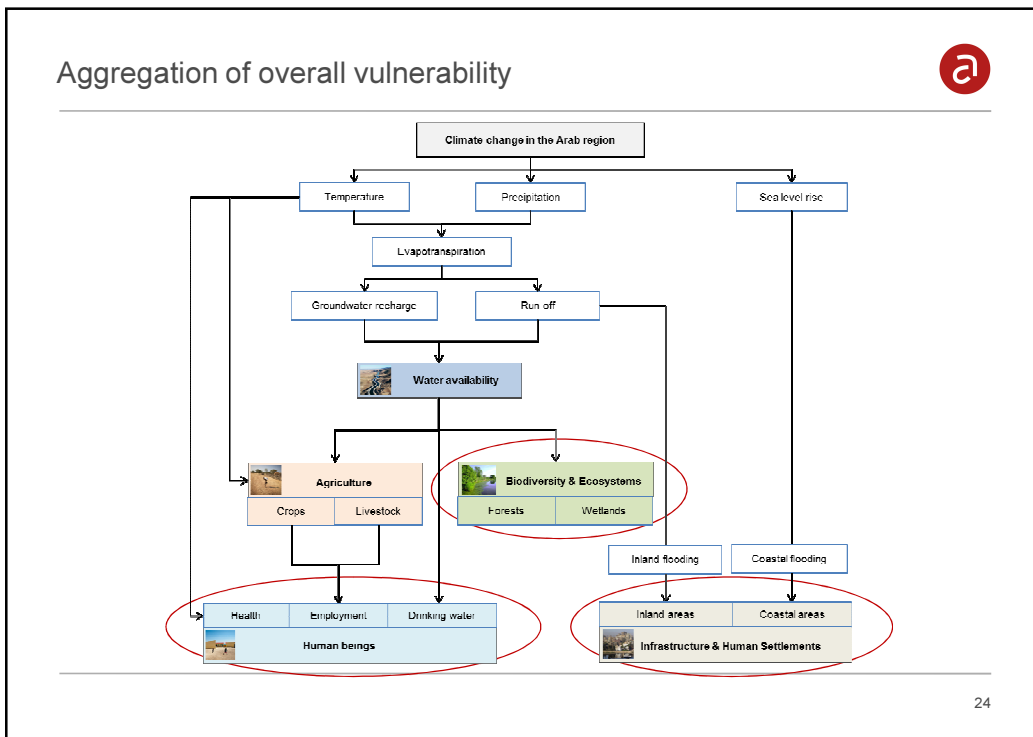

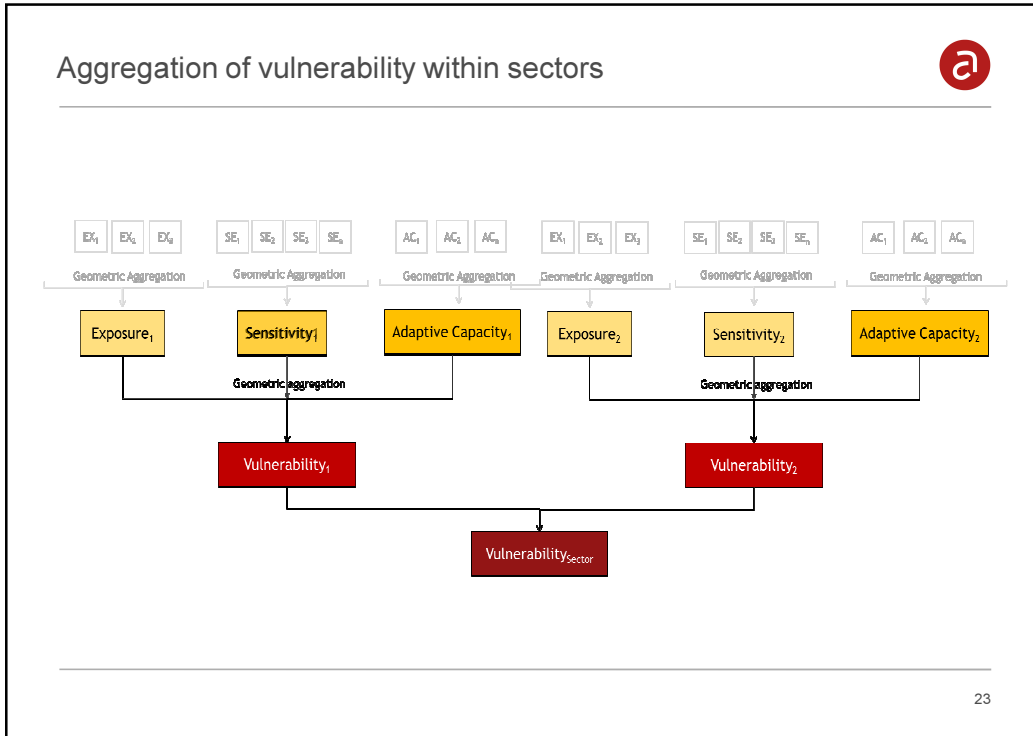

19

## Aggregation of vulnerability components

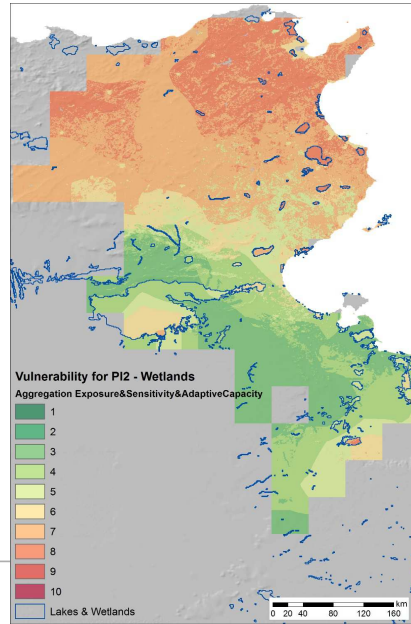

20

Final Step: Mapping vulnerability (example: wetlands)

Source: EURAC.
