Multidimensional poverty

SDG1 requires countries to 'End poverty in all its forms everywhere'

Target 1.2.2 – By 2030, reduce at least by half the proportion of men, women and children of all ages living in poverty in all its dimensions according to **national** definitions.

People with Disabilities (PwDs) - implied in principle of 'LEAVE NO ONE BEHIND'

Evidence on poverty amongst PwDs

- Disability Data Report (2023) by Mitra et al.: incidence of **multidimensional poverty** amongst PwDs in 15 countries, including in Mauritania.
- PwDs were **more often poor** than people without disabilities. More than half of PwDs were poor.
- People with **high support needs** were more often poor than those with less support needs. Women and those in rural areas were poorer.

How to measure multidimensional poverty

Select Dimensions, Indicators, Weights

Identify who is Poor:

If they are deprived in at least some share of weighted indicators, such as 25%, 33%, etc. (the 'poverty cut-off')

Compute & disaggregate:

$$\text{MPI} = H \times A$$

H (Incidence) = Percentage of people who are poor

A (Intensity) = Average deprivation score among poor

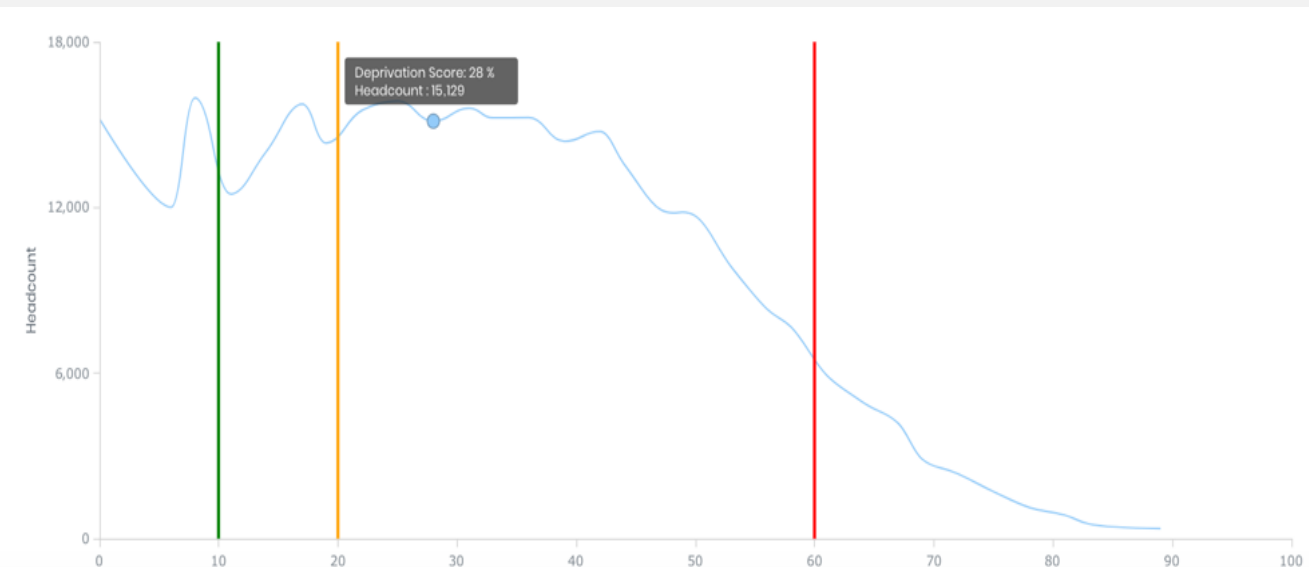

Types of MPIs

- The Global MPI: internationally comparable measure in more than 100 countries. Computed by OPHI, jointly with UNDP. Published annually.
- Arab MPI: Tailored to the region and comparable. Computed by ESCWA.
- National MPIs: Dimensions and indicators tailored to country contexts and reflect national priorities. Official statistics.

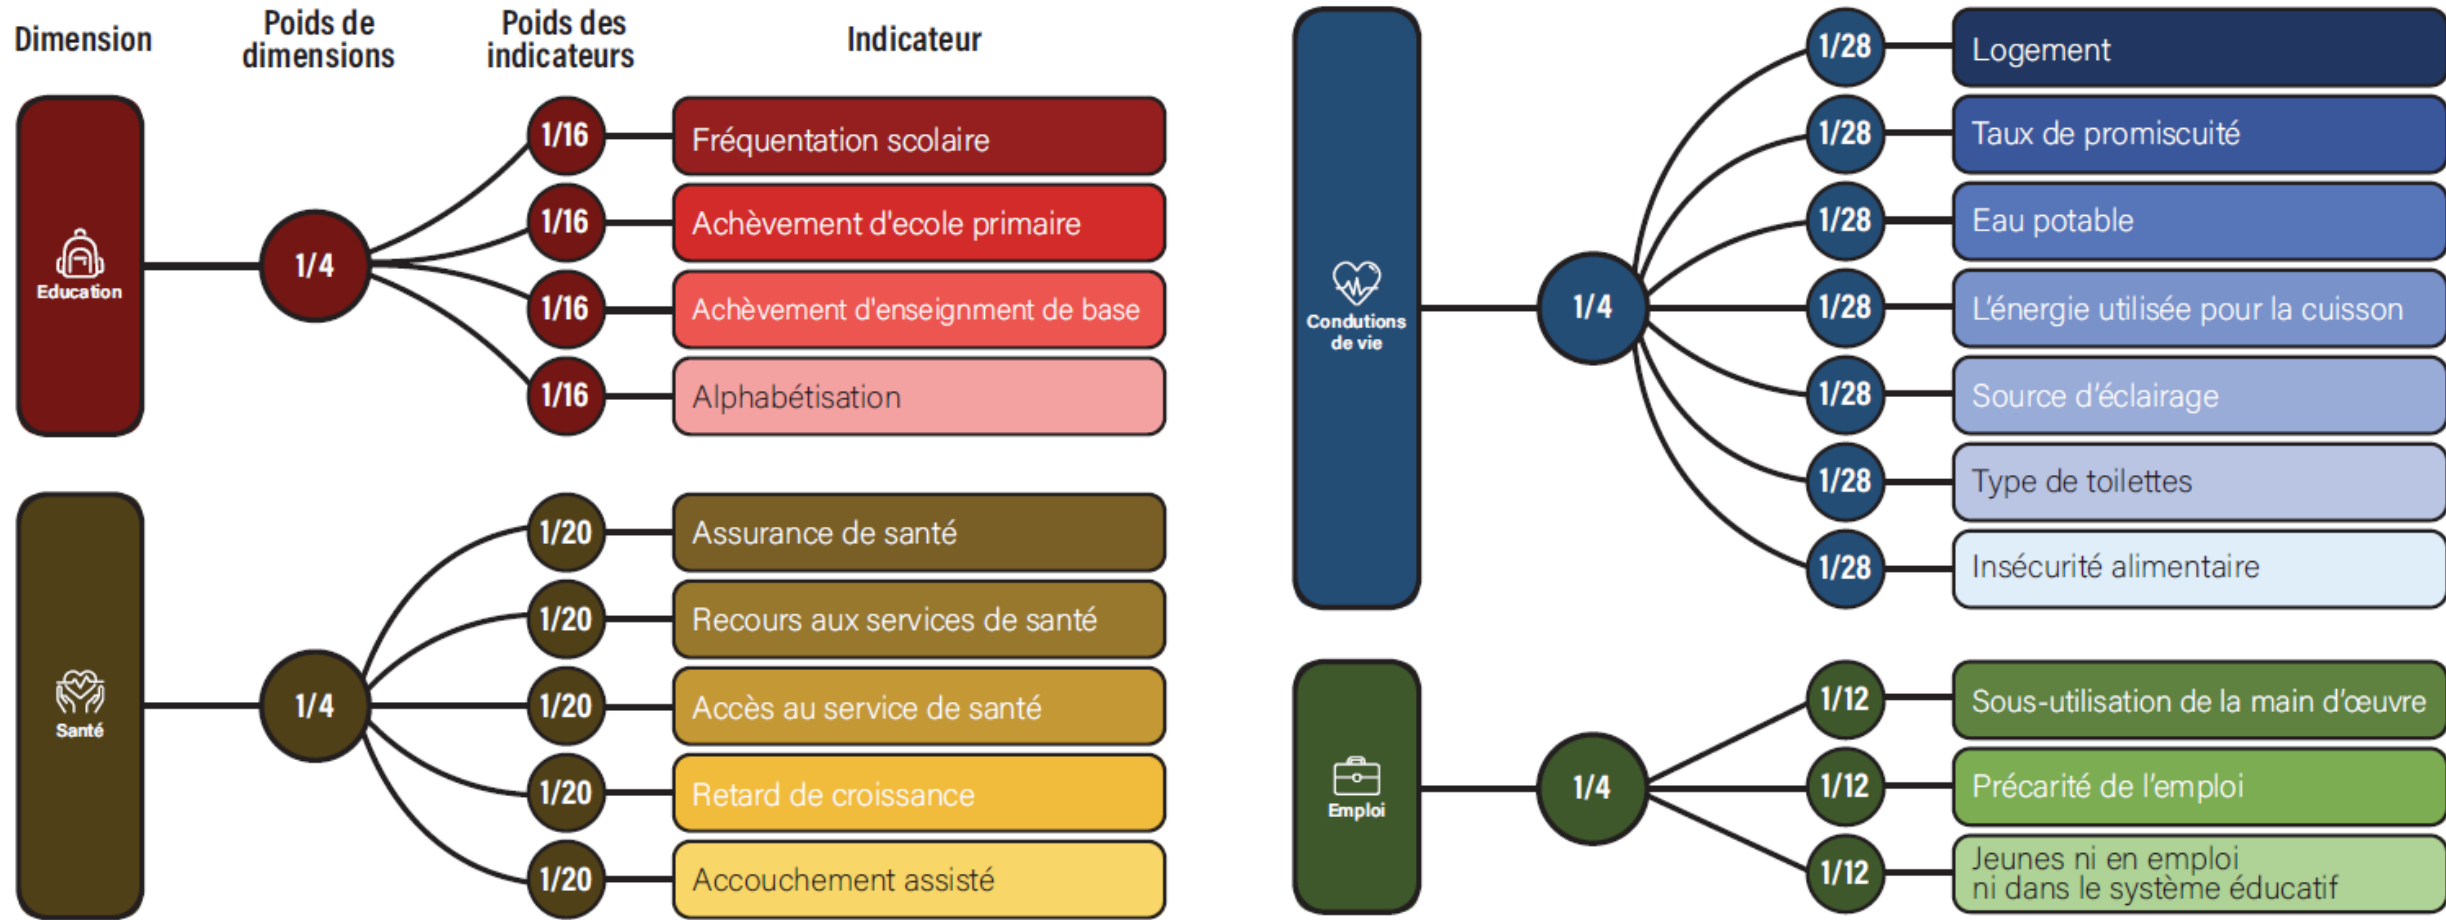

Policy uses of National MPIs

- **Complement** monetary poverty statistics
- **Track poverty** over time (official statistics) as SDG 1.2
- **Allocate resources** by sector and by region
- **Target** marginalized regions, groups, or households
- **Coordinate** policy across sectors and subnational levels
- **Adjust** policies by what works (measure to manage)
- **Leave No One Behind** see the poorest & track trends
- **Be Transparent** so all stakeholders engage

- ESCWA online tool to help measure the multidimensional poverty, calculate MPIs, and expand on the disaggregation that are essential in interpreting the results. Link: <https://mpi.unescwa.org/>.
- The state-of-the-art online platform of the MPI Assist Tool (MAT) enables policy makers to construct an appropriate national MPI using advanced diagnostics, with higher ownership, transparency, accountability, and reduced cost/efforts.

Set the deprivation cut-offs

Health

 **NMPI_Access to health services**  18,015  42,585

Household is deprived if the distance between the household's accommodation and the nearest health facility is more than 5 km

 **NMPI_Allowance to health services**  12,163  48,424

Household is deprived if at least one member has been ill in the last two weeks and he did not consult a health service.

 **NMPI_Health insurance**  52,701  7,899

Household is deprived if no one within the household is covered by any form of health insurance

 **NMPI_Malnutrition**  16,527  42,108

Household is deprived if at least one child under the age of 60 months is suffering from malnutrition

 **NMPI_Skilled birth attendance**  12,295  48,305

Household is deprived if at least one child under the age of 5 who was not born with the assistance of qualified personnel or was born at home or otherwise

 **NMPI_Cooking fuel**  32,422  28,177

Recommendations: Measurement and Analysis

- People with disabilities continue to be left behind. Important to **disaggregate** multidimensional poverty for PwDs, by type and severity of the disability.
- Include questions on **functional** difficulties, such as the set of Washington Group Questions (difficulties with seeing, hearing, walking, learning, self-care, and communication).
- **Oversample** PwDs in surveys to be able to disaggregate within the group, by gender, location, etc.
