Session 11

Calibration and Simulation of the model

Simulation with the AUTA Model

Simulations

- We have retained two simulation plans: the first simulation (Sim 1) holds a 10% increase in the volume of labor and the second simulation (Sim 2) analyzes the case of a 10% increase in capital specific to the branch of services

Simulation 1

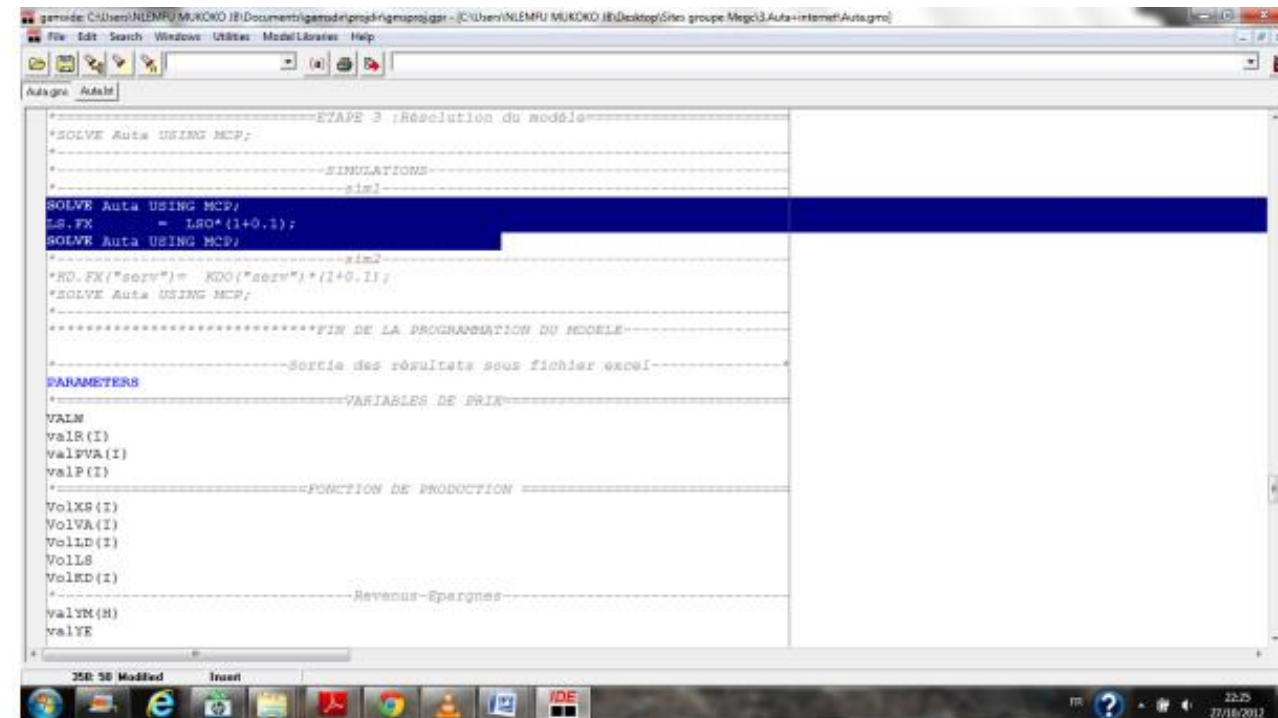

- 10% increase in labor volume.
- The concern at this level, is how to introduce this simulation in our model. As a reminder, the simulations are realized on exogenous variables as highlighted above. In the occurrence, of the case that concerns us, it's the variable labour (LS.FX).

To view the 10% increase, we will have:

Solve Auta using MCP;

LS.FX=LSO*(1+0.1);

Solve Auta using MCP;

```
-----ETAPE 3 : Résolution du modèle-----
*SOLVE Auta USING MCP;
-----
-----SIMULATIONS-----
sim1
SOLVE Auta USING MCP;
LS.FX = LSO*(1+0.1);
SOLVE Auta USING MCP;
-----
sim2
*RD.FX("serv")= KDO("serv")*(1+0.1);
*SOLVE Auta USING MCP;
-----
*****FIN DE LA PROGRAMMATION DU MODELE-----
-----Sortie des résultats sous fichier excel-----
PARAMETERS
-----VARIABLES DE PRIX-----
VALM
valR(I)
valPVA(I)
valP(I)
-----FONCTION DE PRODUCTION-----
VolXS(I)
VolVA(I)
VolLD(I)
VolLS
VolKD(I)
-----Revenus-Eparges-----
valYM(H)
valYE
```

- Change the name of the output sheet on Excel from

FILE Val/
 Auta.xls/;
 Val.pc=6
 val.nd=4
 put val;

To

FILE Val/
 Auta_sim1.xls/;
 Val.pc=6;
 Val.pc=4
 put val;

The screenshot shows a code editor window with the following code:

```

file val /
  Auta_sim1.XLS/;
  val.pc=6;
  val.nd=3;
put val;

put 'MODELE Auta : Modèle à économie fermée sans Gouvernement';
put '//';
put 'TABLEAU 1 : LES PRIX '//;
put 'Variables' put 'Branche' put 'Branche' put 'Reference' put 'Simulation' put 'Variation en%';
put 'w' put ' ' put ' ' put 'w' put 'w.l' put 'valw' /;
loop(i, put'r' put i.tl put'' put ro(i) put r.l(i) put valr(i));
loop(i, put'p' put i.tl put'' put pvo(i) put pv.l(i) put valpva(i));
loop(i, put'p' put i.tl put'' put po(i) put p.l(i) put valp(i) /);

put '//';
put 'TABLEAU 2 : LA PRODUCTION';
put 'Variables' put 'Branche' put 'Branche' put 'Reference' put 'Simulation' put 'Variation en%';
loop(i, put'xs' put i.tl put'' put xso(i) put xs.l(i) put Volks(i) /);
loop(i, put'va' put i.tl put'' put vac(i) put va.l(i) put Volva(i) /);
loop(i, put'ld' put i.tl put'' put ldo(i) put ld.l(i) put Volld(i) /);
put'ls' put ' ' put ' ' put 'lso' put 'ls.l' put 'volls' /;
loop(i, put'kd' put i.tl put'' put kdo(i) put kd.l(i) put Volkd(i));
loop(i, put'ci' put i.tl put'' put cro(i) put ci.l(i) put valci(i));
loop(i,j, put 'DI' i.tl,j.tl, put DIO(i,j) put DI.l(i,j) put valDI(i,j) /);

```

The code editor window has a blue highlight over the line `Auta_sim1.XLS/;` in the first block of code. The window title is `Autagr - Autabr`. The status bar at the bottom shows `428 82 Modified Insert` and the system tray shows the date `7/16/2012` and time `12:27`.

- Next, File/Run or F9 to solve the model and recover the results sheet <<Auta_sim1.xls>> in Documents/Gamsdir/projdir/

TABLE 6 : variation equivalente

	HS	HK	All
Change in net	7.476		
Equivalent v	7.361	7.731	7.476

As you can see at the level of the last column, the simulation had an impact on the studied economy. All that is left is to interpret the different variations that were noted

Simulation 2

- 10% increase in capital specific to the services branch.
To view the 10% increase, we will:

Solve Auta using MCP

KD.FX('serv')= KDO ('serv')*(1+0.1);

Solve Auta using MCP

- Change the name of the Excel output sheet file from:

FILE Val/		FILE VAL/
Auta.xls.xls/;		Auta_sim2.xls/;
Val.pc=6;	TO	Val.pc=6;
Val.nd=4;		Val.pc=4
put val;		put val;

- Following the same procedures as we did with simulation 1, we will obtain the results as displayed below

Autos_sim2 - Microsoft Excel

73 BLAISE NLEMFU
74 blaise_nlemfu@yahoo.fr
75 octobre 2012

We have the results of both our simulations, the only thing left to do is interpret them.

Interpretations

- To interpret the results of our simulations, a theoretical analysis of the probable direct and indirect (or induced) effects caused by the choc is needed. The analysis should put into evidence the dominant effects and the propagation mechanism (pinpoint the training effect) of the simulation in the model. Next, compare the results of this theoretical analysis by those found with the model, thereby drawing the consequences on the points of agreement and divergence.
- Analyze the effects of supply and demand, the mechanisms of the price formation and the origin of the differences between sector.
- Interpret the variation of price in relation to cash and other prices.

Scenario 1: 10% increase in the labor volume

- As an example, for the first simulation, we have:

The decrease in salary is considered as the indirect effect

The indirect effects (or induced) are a result of:

the decrease in salary, which would have an impact on the relative price of capital that increased (r/s); labor intensive sectors being favored because their price decreased (sectorial effect); which would induce different implications on the production sectors (**supply effect**) and household income. The latter (by combining the effects of price, of revenue even substitution), would have an impact on the demand of goods & services

Scenario 2: 10% increase in specific capital in services

- The same analysis can be done for the second simulation:

The direct effect is the decrease in return on capital in the branch of services with as a consequence the substitution of labor by capital (indirect effect) in this branch, which favors sectors like agriculture and labor intensive sectors (benefiting from the freed up labor).

Incidentally, the increase in specific capital in services has an impact on those in the two other branches (agriculture and industry), which becomes relatively rare and therefore return increases.

The combination of all these elements has implications on the formation of price, household income, as well as consumption and savings relative to investments.

A small, rectangular white card with a slightly textured surface is placed on a dark brown wooden surface. The card is oriented vertically and features the words "Thank You" on the top line and "Very Much" on the bottom line, both written in a black, elegant cursive script. The card is positioned in the center of the frame, with a soft shadow cast to its right. The background is a plain, light-colored wall, and the lighting is soft and even.

Thank You
Very Much
